REPORT DETAILS

USER'S GUIDE

Wharry Sharpe Research annually publishes thousands of Global Advanced Markets Outlook reports. These reports feature market sales estimates and market sizing data for six historical years, two forecast years and a five-year projection for more than 40 countries.

The Global Advanced Markets Outlook series includes all market definitions from the U.S. Census (NAICS). Sectors include manufacturing, utilities, construction, retail, professional services, transportation, wholesale, arts/entertainment, finance, and publishing.

The Global Advanced Markets Outlook reports also break out market sales by value added, intermediate inputs and gross operation surplus estimates.

Summary pages highlight 1) market sales by country and 2) market sales by region (North America, Europe, Asia-Pacific, Latin America, Africa, and Middle East).

Additional data includes supply of commodities and use of commodities estimates. The supply of commodities is the the amount of each commodity that is produced domestically by each market. The use of commodities is the amount of a commodity purchased by each market as an intermediate input into the market's production process.

The reports do not list companies in each country and market but provides only market sizing data for our clients that only need the data rather than the additional expense of company lists (or written analysis).

Market analysis users will find the Global Advanced Markets Outlook reports useful for 1) market sizing, 2) sales forecasting, 3) competitive intelligence, and 4) sales territory potentials. Budgeters and planners use the Outlook reports for future capital expenditures and resource allocation. Investors use the Outlook reports for analyzing growth investments.

METHODOLOGY

DEFINITIONS

Wharry Sharpe Research annually publishes thousands of Global Advanced Markets Outlook reports. These reports feature market sales estimates and market sizing data for six historical years, two forecast years and a five-year projection for more than 40 countries.

The methodology for the Global Advanced Markets Outlook reports is based on Wharry Sharpe's unique estimation database and numerous sources:

1. The basis of the historical sales data is the U.S. Census Economic Survey.
2. The basis of the Value Added, Intermediate Inputs, Gross Output Surplus, Supply of Commodities and Use of Commodities is the U.S. Bureau of Economic Analysis.
3. Forecasts and projections use this historical data to estimate future markets (with regression analysis).
4. Weights and adjustments are made to market sales and country GDP measures when they are outside acceptable ranges.
5. Country GDP data (historical) is based on World Bank databases. Forecast GDP data uses regression analysis for future trends and horizontal weights for the global GDP summary.
6. Market sales by country use the proportion by markets to the relative size of each country (by GDP).
7. Market sales by country also are weighted by sector ratios of GDP for manufacturing, retail and service sectors.

APPENDIX

Primary Data Sources for Global Advanced Markets Outlook reports

U.S. Economic Census

General Definition From U.S. Census

Every five years, the U.S. Census Bureau collects extensive statistics about businesses that are essential to understanding the American economy. This official count, better known as the Economic Census, serves as the foundation for the measurement of U.S. businesses and their economic impact. As part of the Census Bureau's mission to provide timely information on the health of the U.S. economy, this "business" census serves as the most extensive collection of data related to business activity. Nearly 4 million business locations, large, medium, and small, covering most industries and all geographic areas of the United States will receive surveys tailored to their primary business activity.

U.S. County Business Patterns

General Definition From U.S. Census

County Business Patterns (CBP) is an annual series that provides subnational economic data by industry. This series includes the number of establishments, employment during the week of March 12, first quarter payroll, and annual payroll. This data is useful for studying the economic activity of small areas; analyzing economic changes over time; and as a benchmark for other statistical series, surveys, and databases between economic censuses. Businesses use the data for analyzing market potential, measuring the effectiveness of sales and advertising programs, setting sales quotas, and developing budgets. Government agencies use the data for administration and planning.

Supply of Commodities/Use of Commodities

General Definition From U.S. Bureau of Economic Analysis

In the economy, the total supply of commodities that are available for use are primarily those that are produced by domestic industry. However, additional commodities enter the supply as imports or as net withdrawals from inventory. The commodities that make up supply are disbursed either for intermediate use by industries to produce other commodities or for final use. Transactions span the broad range of these activities and involve both the derivation and the use of the supply of commodities. Examples of transactions include the following: Shipments of processed steel from the steel industry to automotive plants, exports of grain to foreign countries, withdrawals of petroleum from inventory, sales of appliances to consumers, payments of wages and salaries to employees, and payments of property taxes by businesses. In the real world, commodities are generally carried by some mode of transportation from the producer or importer to a wholesaler (and in the case of consumer goods, through a retailer) and then to the purchaser. Transactions show the direct flow of goods or services to users, but they do not explicitly show the flows through transportation and trade channels. For example, the sale of a washing machine to a consumer is shown as a transaction between the producer and the consumer.

Within final uses, transactions represent either a use of commodities or a part of the supply of commodities, depending on the type of final use. PCE, PFI, and government represent the use of commodities for either consumption or investment.

The domestic supply is the supply of commodities available to be consumed within the United States. It is equal to domestic output (in basic value) plus imports and sales from final uses minus exports and change in private inventories. In order to estimate the domestic supply of a commodity, it is necessary to estimate the detailed transactions for inventories, exports, imports, and sales of scrap and used goods.
